**Dental Cleaning with Possible Extractions**

What we will do today:

- 1) Pre-anesthetic examination
- 2) Pre-anesthetic blood work (if not done prior to today)
- 3) +/- Intravenous catheter and fluid therapy
- 4) General anesthesia
- 5) Dental Cleaning
- 6) Extract any teeth deemed necessary by the veterinarian
- 7) Polish teeth
- 8) Apply fluoride treatment
- 9) Dispense antibiotics and pain medications if needed

**In the event that dental extractions or minor dental surgery are discovered to be needed during my pet's dental cleaning, I authorize the following:**

- I authorize the attending veterinarian to do any extractions or procedures deemed necessary while my pet is under anesthesia.
- Please attempt to contact me if anything additional is needed but proceed if I am not available.
- Please contact me regarding any additional procedures. If I am not available, do not proceed. I understand that this may mean my pet will require an additional procedure under anesthesia at a later date.

**Oravet - There are two different options for post dental follow up treatment.** Oravet comes as a sealant applied to the teeth and gums AFTER the cleaning to protect against plaque and tartar OR it is available in a dental chew. It is imperative to keep up with dental care at home to help slow down the progression of dental disease. Please select which one you would prefer.

- Apply Oravet Sealant**
- Send Home Oravet Chews**

**I have read and understand this consent.**
